

# PLA-SET FOR SITE VALIDATION

## PRECISION LOOP ANTENNA

The PLA set consists of two active, battery powered loop antennas intended for site validation. With the broad frequency range from 9 kHz to 30 MHz it is suitable for Normalized Site Attenuation (NSA) measurements and Shielding Effectiveness (SE) measurements.

Normalized Site Attenuation (NSA) measurement at 3 m, 5 m and 10 m distance is convenient due to sufficient dynamic range, all required documentation and calibration. Setup and alignment is easy with the integrated tripod and laser system. A decoupling unit to avoid ground loops is included.

The high dynamic range of the PLA-Set is a benefit for Shielding Effectiveness (SE) can be measured with a high dynamic. No external power amplifier or low noise preamplifier is required.

### PRODUCT HIGHLIGHTS

- Active transmit and receive antenna
- Integrated tripod with laser alignment
- High of transmit power
- Very low noise floor
- Battery powered
- Individually calibrated
- Transport/Flight case included

### APPLICABLE STANDARDS

- CISPR 16-1-4 (draft)
- EN 50147-1
- IEEE 299

### TECHNICAL DATA

	PLA - T	PLA - R
Application	transmit	receive
Frequency range	9 kHz - 30 MHz (broadband stage)  9 kHz - 200 kHz (current stage)	9 kHz - 30 MHz
Antenna area	Square, 60 cm side length	
Antenna height (center)	1.3 m when mounted on the antenna stand	
Temperature stability of antenna factor		
Laboratory (20° C - 25° C)	± 0.05 dB	± 0.025 dB
Field use (10° C - 35° C)	± 0.25 dB	± 0.1 dB
Battery operation time	>8 h typical use for SE and NSA measurement	>24 h continuous use
Batteries	internal, 10 cell NiMH, factory serviceable only	
Laser	Class 2	
Dimensions of Antenna Set	86 x 79 x 46 cm, weight 40 kg
